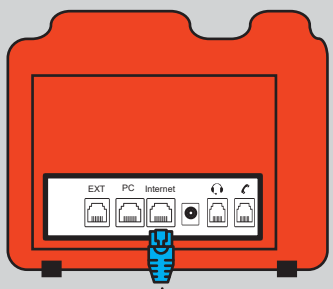
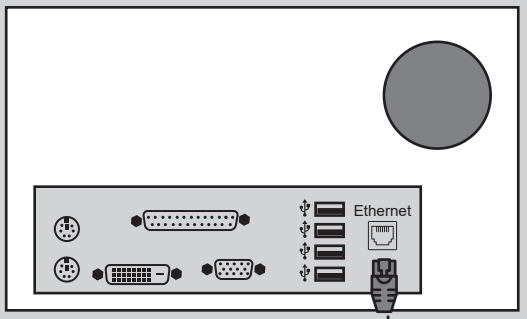
With network switch

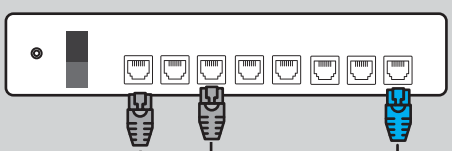
Phone (back)



Computer (back)



Switch



1.

Plug your Internet modem into the port #1 of the VoxSun router.

- If you are using a cable Internet modem, you will need to power cycle your modem after plugging it into the VoxSun Router.

2.

Plug in your phones and computers into the rest of the ports of the VoxSun router.

- If the VoxSun router doesn't have enough ports to accommodate your needs, you can use a switch to increase the number of network ports.

3.

Each phone's "Internet" port has to be plugged into your router or switch. You can use the phone's "PC" port to connect a computer. When doing this, the phone will share its connection with another computer or device that is plugged into its "PC" port.

4.

If you have ordered VoxSun's 4G backup option, plug the 4G modem into the port #5 of the VoxSun router.
